Novatech to Introduce Industry's Most Advanced Biophilic Doorglass – Zen – at IBS 2025 Show

EGG HARBOR TOWNSHIP, N.J. – [Novatech](#), a cutting-edge manufacturer of entry doors, doorglass, patio doors, and tailor-made insulated glass, announces its new line of biophilic doorglass – Zen. The first doorglass of its kind, the innovative Zen line enables builders, designers, and homeowners to add a nature-focused element to the front door. The simple yet elegant Zen wood designs invite nature into the home while simultaneously delivering privacy to occupants with the sandblasted glass option.

Zen is available in two realistic wood designs:

- Walnut – comprised of rich brown tones and deep woodgrain, accentuating modern exterior facades.

- Aspen – evoking simplicity and lightness with clean vertical lines, for an elegant, understated look.

Clear or sandblasted glass options are available for both wood designs, permitting varying levels of privacy. Elegant black printed detailing complements both woodgrains. The unique look of the doorglass can be incorporated into a complete entry system with sidelights integrating the same clear or sandblasted glass used in the door.

“Novatech leads the market in exceptional quality doorglass in contemporary and classic styles, as well as unique designs that transition between traditional and modern tastes,” said Katie Sponseller, Product Designer, Novatech Group. “The company has the expertise, agility, and creativity to reliably deliver new doorglass designs that are a perfect fit for a broad range of market segments.”

Meticulous Manufacturing

The process required to manufacture Zen doorglass is unique to the industry. Ceraprint® printing, a process for applying ceramic ink to glass, is combined with silk screening to imprint the realistic look of aspen or walnut with either frosted or clear glass. The painstaking process results in a high-quality, biophilic doorglass unlike any other options available on the market today.

Superior Energy Efficiency

Zen doorglass performs as well as it looks, engineered to reduce condensation, minimize heat transfer by convection, and improve overall energy performance. Superior energy efficiency is achieved through double-glazing with the company's patented intercept® spacers, warm-edge spacers made from materials with lower thermal conductivity for improved thermal efficiency and moisture control.
