A Healthy Home Starts with a Clean Home

Your vacuum affects your home's indoor air quality. The average person spends more than 90% of their time indoors. According to the U.S. EPA, indoor air quality is up to 5 times more polluted than outdoor air quality! When you vacuum, you may be unconsciously contributing to the problem. That's why choosing the right vacuum is one of the most important decisions you can make to ensure the health of your family.

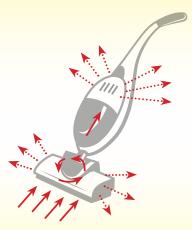

Is your vacuum harming your indoor air?

Vacuums can be one of the biggest threats to healthy indoor air. All the air that comes into a vacuum must come out somewhere! In portable vacuums that air is exhausted into the living area. You can often smell it or see the particles streaming in the sunlight.

Portable vacuums are designed with filters to capture germs and allergens, but many particles will still end up exhausted back into your living space. These particles can aggravate allergies and cause an increase in respiratory issues.

Central Vacuum Systems are the Answer

A central vacuum system is designed to exhaust vacuumed air outside of the living area, leaving only clean air for you and your family to breathe. Get rid of recirculated particles for good - virtually all of the vacuumed dust, bacteria, allergens and viruses are removed into the system.

Vacuumed particles are whisked through the network of tubing inside the walls of your home and deposited into the vacuum unit located outside the living area. The result is no after vacuum smell or dust particles lingering in the air.

Central Vacuums are as Convenient as They are Healthy

Central vacuums bring up to 5x more vacuum power to every room of your home, even the garage. Clean every surface, from floors to counters to furniture, quickly and effectively.
